First Controlled Release

Code Escape: Build, Test and Release of Version 0.1.0

Capstone Project (Unity, Windows)

Group Number	IT22
Group Members	Jean Joseph C. Mallari Mark Daniel M. Haguisan Louis Angelo D. Junio Alynus Job C. Tombado
Release	Version 0.1.0 (testing build), 8 November 2026
Source	Branch `release-v0.1.0`, commit `f8b27a8`, tag `v0.1.0`
Repository	https://github.com/jjcmall/Code-Escape-IT22
Release artifact	`CodeEscape-v0.1.0.zip` (64.5 MB)
Course / Section	*[Course and section]*
Instructor	*[Instructor]*

Status: the build, package, tag and release notes are done. The tests that need a real account, and a test on a second computer, are marked as not run and are still to be done by the group.

Part I. Deployment Environment Plan

Environment	Where / Platform	Purpose	Required Software / Dependencies
Development	Windows 11 PC with the Unity Editor	Write and test the game; commit to Git	Unity 6000.5.10f1 (C#, URP, Input System, uGUI), a code editor (VS Code settings are in the repository), Git with GitHub Desktop, a Unity account linked to the project for Unity Gaming Services
Testing	(1) A clean folder on the same PC, run from the extracted zip, outside the editor (done 8 Nov 2026). (2) A second Windows computer of another member (to be done).	Check that the packaged release runs without the development setup	Windows 10 or 11, 64-bit; internet connection; no Unity Editor needed
Release / Target	Windows 64-bit desktop or laptop (student computers, school laboratory)	The player runs the game	`CodeEscape-v0.1.0.zip` (the packaged build); internet for sign-in and Cloud Save through Unity Gaming Services

Part II. Deployment Technology Decision

Technology	Needed?	Intended Use	Reason
Virtual Machine	Possibly	A clean Windows environment for testing the release, if no second computer is available	Users run the game directly on Windows, so a VM is not needed to run it. It would only help to test a fresh Windows install. For this release the test used a clean folder with no previous game data, and a second computer is preferred.
Container / Docker	No	None	The game is a desktop client. There is no backend service of our own to package, because accounts and progress use Unity Authentication and Cloud Save.
Cloud Platform	Yes	Unity Gaming Services: Authentication (username and password) and Cloud Save	Progress must belong to a student account and load on any computer. This is an existing project requirement, not extra infrastructure.

Part III. Versioning Plan

Convention: `MAJOR.MINOR.PATCH`, with a `v` prefix in tags and file names.

Current Version	0.1.0 (testing build)
Version Number	`0.1.0`, stored in Unity as `bundleVersion` (commit `f8b27a8`) and tagged `v0.1.0`
Reason for Version Number	MAJOR is 0 because the capstone is not yet the agreed complete release. MINOR is 1 because this is the first controlled build with the working game. PATCH is 0 because it is not a fix release.
Included Features	Python puzzle game with six levels on a level map; 32 Python challenges checked by running code in a sandboxed interpreter; learning cards, hints and scoring; achievements and level stars; story systems and the prologue comic; username and password accounts with Cloud Save progress; one shared menu theme.
Excluded / Planned Features	PHP and SQL challenges (content is kept for future versions); builds for platforms other than Windows; a password reset inside the game.

Succeeding versions

Change	Version After Change	Reason
Fix an incorrect score calculation	0.1.1	A fix with no new feature raises PATCH.
Add leaderboard functionality	0.2.0	A new working feature raises MINOR and resets PATCH.
Major redesign affecting saved data compatibility	1.0.0 (or 2.0.0 once 1.0.0 exists)	An incompatible change raises MAJOR. While we are on 0.x, the first MAJOR is the agreed 1.0.0.

Part IV. Release Readiness Check

This build is labelled a **testing build** because two checks do not pass yet: the pull requests were not reviewed and merged before the build. This is documented here instead of hidden.

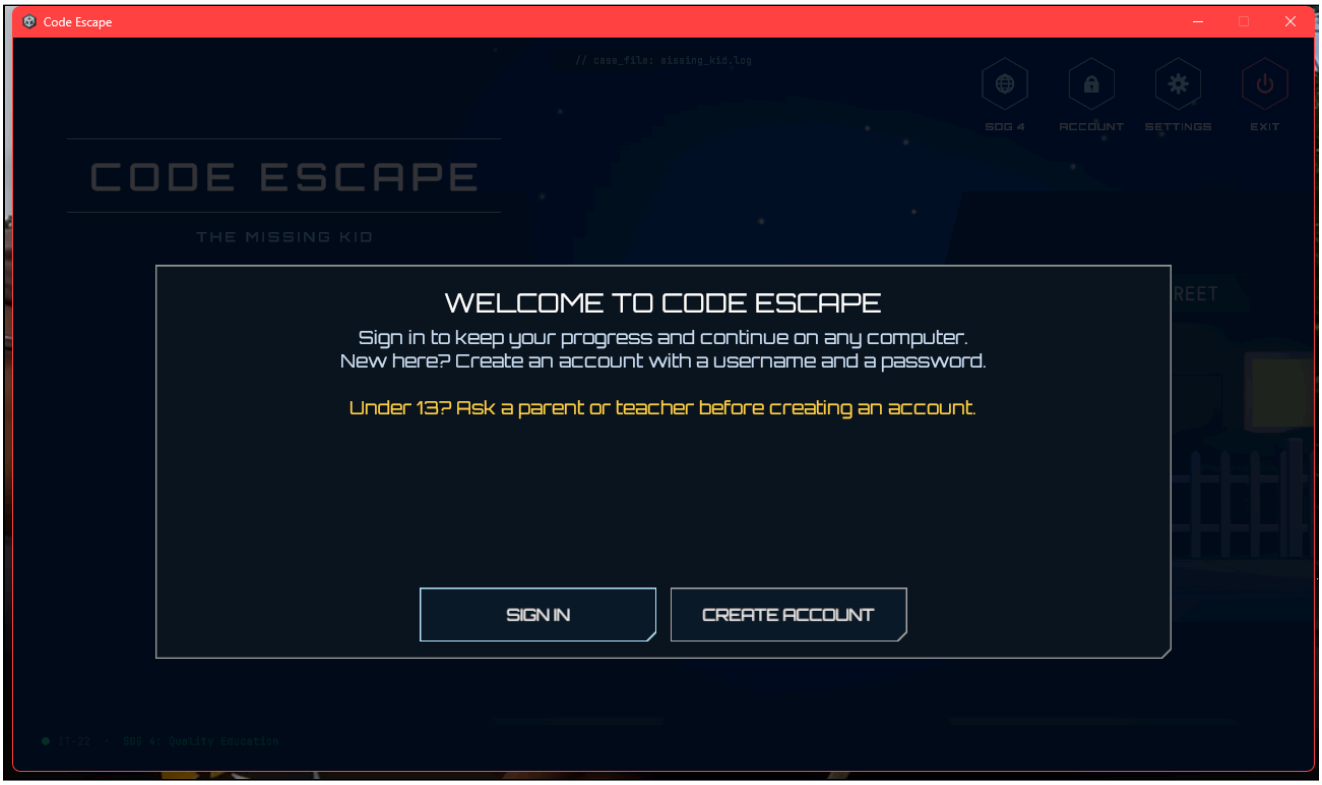

Release Check	Status	Evidence / Remarks
Required changes have been reviewed	Fail	Pull Request #1 (`refactor/save-progress`) is open with no reviewer. The menu theme branch has no pull request yet.
Accepted changes are integrated	Fail	The release branch `release-v0.1.0` carries the commits of both task branches, but they are not merged into `main` yet.
Correct source version is being used	Pass	The build was made from a clean checkout of commit `f8b27a8` (no uncommitted files), tagged `v0.1.0`.
Project opens without critical errors	Pass	The Unity Console showed no errors in the editor, and the batch build compiled with 0 compile errors.
Required scenes/modules are included	Pass	All 12 scenes are enabled in Build Settings (main menu, language select, level map, intro, six levels, ending, results).
Database/configuration is correct for testing	Pass	The project is linked to its Unity Cloud project. In the editor on 8 Nov 2026 the game signed in, loaded and saved progress to Cloud Save. The packaged build was only checked up to the welcome screen.
Temporary/debug content is reviewed	Partial	The test scaffold folder `Assets/playmode test` is untracked and is not in the commit. A full review of debug content in scenes was not done.
Target platform is selected correctly	Pass	Windows 64-bit (`StandaloneWindows64`).
Version number is updated	Pass	`bundleVersion` changed from 1.0 to 0.1.0 in commit `f8b27a8`.
Build can be produced successfully	Pass	Unity batch build, result Success, 9.5 minutes.

Part V. Build and Release Evidence

How the build was made

1. Set the version to 0.1.0 and committed it (`f8b27a8` on `release-v0.1.0`).
2. Made a clean checkout of that commit in a separate folder, so only committed files are built.
3. Ran Unity 6000.5.10f1 in batch mode with `-buildWindows64Player`, which builds the scenes enabled in Build Settings.
4. Copied the result to a release folder without the Burst debug information folder (not needed by players), added `README.txt`, `VERSION.txt` and `RELEASE_NOTES.txt`, and zipped it.
5. Tagged the source commit `v0.1.0`.

Build result	Success, 0 compile errors, 9.5 minutes (including the first asset import of the clean checkout)
Release folder	`CodeEscape-v0.1.0/`: `CodeEscape.exe`, `CodeEscape_Data/`, `UnityPlayer.dll`, `MonoBleedingEdge/`, `D3D12/`, `DirectML.dll`, `dstorage.dll`, `dstoragecore.dll`, `UnityCrashHandler64.exe`, `README.txt`, `VERSION.txt`, `RELEASE_NOTES.txt`
Size	189 MB unpacked; `CodeEscape-v0.1.0.zip` is 64.5 MB
SHA-256 of the zip	`6AA6FE4345CE2A7C8FEA932C38A88EBCE57EF0D8E344744CBA8E29043F43EC6A`
Version identification	The version is in `VERSION.txt`, `README.txt`, the zip name and the Unity setting `bundleVersion`. It is not shown inside the game menus, and the exe file properties show the Unity engine version, not the game version.

The packaged build (`CodeEscape.exe` from the extracted zip) after launch: the welcome screen with SIGN IN and CREATE ACCOUNT.

Part VI. Release Testing

Test environment: Windows 11 PC, the zip extracted to a clean folder, run as `CodeEscape.exe` (not from the Unity Editor). No previous game data existed for the standalone game on this PC (no saved settings, no log), so it ran as a first-time user. It is the same computer used for development, so a test on a second computer is still needed. Date: 8 November 2026.

Release Test	Expected Result	Actual Result	Status
Application launches	The application opens normally	The window titled "Code Escape" opened, stayed running and responsive after 25 seconds, using about 790 MB of memory.	Pass
Main feature works	A player can sign in and play a level	The welcome screen with SIGN IN and CREATE ACCOUNT appeared. Signing in and playing a level was not tested because it needs a real account.	Not run
Save/load works	Progress is saved and loaded with an account	Not tested on the packaged build (needs an account). The same save and load logic passed 8 of 8 tests in the Unity Editor on 8 Nov 2026.	Not run
Required assets load	Menu scene, fonts, sprites and background load without errors	The main menu background, the Orbitron font and the themed panel and buttons are visible. `Player.log` has no errors or exceptions. Other scenes were not opened.	Pass (main menu only)
Application can close normally	The window closes without a crash	The window was closed, the process ended, and the log ends with a normal shutdown.	Pass
Version is identifiable	The version can be found	`VERSION.txt` in the release folder says 0.1.0 with the commit and tag, and the zip name contains `v0.1.0`. The game menus do not show it.	Pass (by file)

Result: 4 passed, 2 not run. The two that were not run are the ones that need a real account, so the group should run them on a second computer before calling the release tested.

Part VII. Release Notes and Traceability

Project	Code Escape (Group IT22)
Version	0.1.0
Release Date	8 November 2026
Release Type	Testing
Source Version / Branch / Changeset	Tag `v0.1.0`, commit `f8b27a8`, branch `release-v0.1.0`

Included in This Version

- Python puzzle game with six levels on a level map; cleared levels can be replayed.
- 32 Python challenges checked by running the player's code in a sandboxed interpreter.
- Learning cards, wrong-answer feedback, a hint ladder, scoring (+100 per solved challenge, -25 for the first hint), achievements and level stars.
- Story systems: cutscenes, dialogue, objectives, clue journal and the prologue comic.
- Username and password accounts, with progress saved to Unity Cloud Save and a local save.
- One shared look for menus, HUD and dialogs.

Fixed

- No defect fixes in this version.
- Internal change with no change in behavior: record building and snapshot restoring moved out of `CloudProgressService` into `ProgressRecordBuilder` and `ProgressSnapshotApplier`.

Known Issues

- An internet connection and an account are needed to play.
- There is no password reset in the game; the owner sets a new password in the Unity Dashboard.
- The build is not code-signed, so Windows SmartScreen may warn on first run.
- Pull Request #1 is not reviewed or merged yet.
- Not yet tested on a second computer, and sign-in and save were not tested on the packaged build.

Not Yet Included

- PHP and SQL challenges.
- Builds for platforms other than Windows.

Installation / Running Instructions

1. Extract `CodeEscape-v0.1.0.zip` to a normal folder. Do not run it from inside the zip.
2. Run `CodeEscape.exe`. If Windows SmartScreen warns, choose More info, then Run anyway.
3. Create an account: username 3 to 20 characters; password 8 to 30 characters with upper case, lower case, a number and a symbol. Or sign in.
4. Choose Select Level, then Play. Walk to a door and press E to open its challenge.

Source traceability

```
Released build  ->  Version 0.1.0  ->  Tag v0.1.0  ->  Commit f8b27a8  (branch release-v0.1.0)
Build input     :  clean checkout of f8b27a8, Unity 6000.5.10f1, StandaloneWindows64
Artifact        :  CodeEscape-v0.1.0.zip, SHA-256 6AA6FE43...43EC6A
```

The same release notes are in the repository as `Documentation/Releases/RELEASE_NOTES_v0.1.0.md` and inside the zip as `RELEASE_NOTES.txt`.

Part VIII. Succeeding Release Process

```
Develop Changes (task branch)
  -> Review and Integrate (pull request, review, merge to main)
  -> Determine New Version Number
  -> Update Version (Unity bundleVersion, commit)
  -> Build (clean checkout of that commit, batch build)
  -> Test Packaged Build (from the extracted zip, on a second computer)
  -> Create Release Notes (Documentation/Releases)
  -> Label / Tag Source (git tag vX.Y.Z)
  -> Publish / Archive Release (GitHub Release with the zip and its SHA-256)
```

If the next change is only a bug fix, what will the next version be? 0.1.1.

If the next change introduces a new working feature, what will the next version be? 0.2.0.

What conditions should be met before Version 1.0.0?

- All task branches are reviewed and merged into `main`, and the release is built from `main`.
- The features the group agreed for the capstone are complete.
- The packaged build passes every release test on at least one other computer, including sign-in, play, save and load.
- There are no known critical bugs, and the known issues are written in the release notes.
- The release has a tag, release notes, and a published zip with its SHA-256.

Repository / Version-Control Reference

Repository	https://github.com/jjcmall/Code-Escape-IT22
Release branch	`release-v0.1.0` (published on GitHub when the group publishes it)
Release tag	`v0.1.0` on commit `f8b27a8`
Version commit	`f8b27a8`, "Set the version to 0.1.0 for the first controlled release" (Mark Daniel M. Haguisan)

Release Artifact Location

File	`CodeEscape-v0.1.0.zip`, 64.5 MB
Current location	`C:\Users\Carl\Code Escape\Builds\CodeEscape-v0.1.0.zip` on the build computer (the `Builds/` folder is ignored by Git, as it should be)
Distribution	*[To be done by the group: create a GitHub Release for tag v0.1.0 and attach the zip, or use the location approved by the instructor, and write the link here.]*
SHA-256	`6AA6FE4345CE2A7C8FEA932C38A88EBCE57EF0D8E344744CBA8E29043F43EC6A`

Part IX. Individual Release Contribution

Each student submits their own PDF with their own record. File name: Lastname_GroupNumber_FirstRelease.pdf (for example Haguisan_Group22_FirstRelease.pdf).

Member 2	
Student Name	Mark Daniel M. Haguisan
Group Number	IT22
Release Version	0.1.0
Assigned Release Responsibility	Release preparation: version update, build, packaging, release testing and release notes
Specific Contribution	Set the version to 0.1.0; built the Windows release from a clean checkout of the commit; packaged and zipped it with README, VERSION and release notes; tested the packaged exe from a clean folder; tagged `v0.1.0`; wrote the release notes.
Evidence	Commit `f8b27a8`; tag `v0.1.0`; `CodeEscape-v0.1.0.zip` (SHA-256 starting 6AA6FE43); the test table in Part VI; `Documentation/Releases/RELEASE_NOTES_v0.1.0.md`
What I learned (about 100 words)	I learned that developing a feature and releasing it are different jobs. In development the program only has to run in my editor. For the release I had to choose a version number, build from a clean checkout of one exact commit, package only what the player needs, test the packaged exe outside the editor, and record the commit and tag so the build can be traced. I also learned to say plainly what was not tested, such as signing in on a second computer. For the next release I will build from the reviewed main branch and follow the same steps.
